PROBLEMS

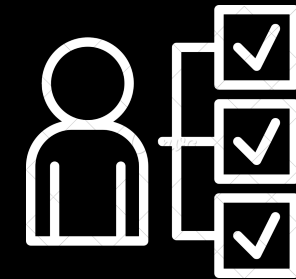

Users

Effectively reporting harmful web services poses a significant challenge, necessitating knowledge of service provider contact information, website details, and other pertinent data, however, the unfortunate lack of user incentives to report such issues often hinders timely and appropriate action against these potentially dangerous web services.

Browsers and Wallets

Regrettably, the absence of a solution for Web2 and Web3 browsers and wallets to verify the trustworthiness of web services leaves users exposed to potential harm, rendering them vulnerable to various threats.

Web Service Providers

Ensuring the trustworthiness of every web service proves to be an uphill task, as domain registrars, DNS providers, and hosting providers face the challenge of monitoring each service individually, making it difficult to safeguard users against potential threats.

SOLUTION

Reporting

Our platform offers easy reporting of harmful web services by just providing a URL and type of abuse while rewarding users for helping make the web more secure.

APIs

We empower browsers and wallets with seamless access to our blacklist via robust APIs, enabling them to efficiently check the trustworthiness of web services.

Forwarding

Upon blacklisting of any web service, its details will be promptly forwarded to the service providers for further action to be taken against any harmful web services.

INTEGRATION WITH SERVICE PROVIDERS AND WALLETS

Step 1

It got added to the website blacklist because a proposal against it was validated or one of our partner wallets blacklisted it.

Step 2

If the website got blacklisted due to the proposal, the user who submitted that proposal will receive a share in the daily IT reward pool.

Step 3

Our partner wallet checks our APIs to see if a website is blacklisted. If it is, the wallet blocks user access..

Step 4

As soon as a website is blacklisted, the platform will notify its service providers, including the domain registrar and hosting provider.

Step 5

Providers may suspend harmful blacklisted sites. If due to a proposal, the validator gets a share in the daily IT reward pool.

PLATFORM

USERS, BUSINESSES, AND APIS

Any user can register on Werepl and submit proposals.
Users will enjoy great IT rewards if their proposal is validated.
Any business with a domain name can register on Werepl.
A registered business can request a review to verify its domain.
We give web2 and web3 browsers/wallets access to our blacklist through our powerful APIs

PROPOSALS SUBMISSION

Users can now submit proposals on our web service without a pass, but they cannot enter proposal details on their pass in the future.
Proposals can only be submitted if a supported service provider is used on our platform.
Proposals cannot be submitted against a verified domain.
If a proposal is rejected and the user feels there has been a mistake, they can resubmit the proposal once.

LIMITATIONS

If a user's proposal is rejected twice in a single day by our validator, they will not be able to submit a new proposal for three days.
If a proposal has already been submitted for a URL against the same type of abuse and is pending or approved, a new proposal for that URL will not be accepted.
If a previous proposal against a URL has been rejected by our validator or service provider, a new proposal for that URL cannot be submitted for 14 days.

BLACKLIST

THERE ARE TWO WAYS TO ADD A WEB SERVICE TO THE BLACKLIST OF WEREPL

PROPOSALS

The web service against which the proposal will be validated.

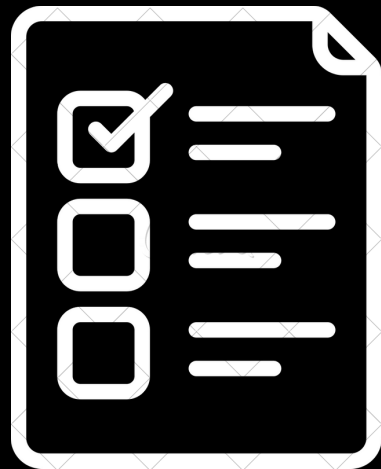

PARTNERS

Our partnered web service providers, browsers, and wallets have the ability to blacklist web services, and any web service that gets blacklisted by these browsers and wallets will also be reported to their service providers for suspension.

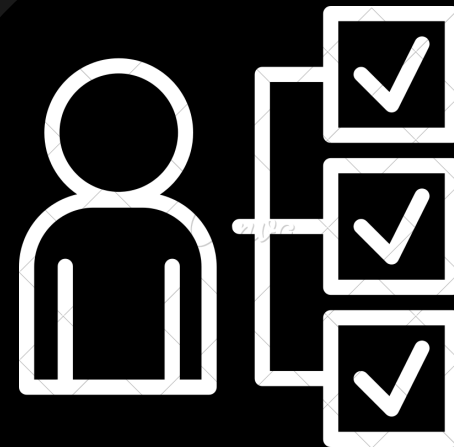

VALIDATORS

LISTING

Validators are selected by Werepl globally based on their experience identifying illegal online activities. Werepl will list new validators on an ongoing basis. However, if a validator incurs three penalties in one quarter, they will be delisted from the platform, and will also be subjected to a penalty of 20% of the IT they have staked, while the remaining amount can be unstaked by the validator.

RESPONSIBILITY

Our validators are responsible for verifying whether URLs reported on our platform are harmful or not. If a user's proposal is rejected and they resubmit the same proposal, the validator who initially rejected the proposal cannot re-validate it.

REWARDS AND PENALTIES

If a proposal is approved by any service provider and is not rejected by two or more service providers, the proposal is considered approved, and the validator who validated the proposal will be eligible for the reward. If a proposal is not approved by any service provider and is rejected by two or more service providers, the web service will be removed from the blacklist, in such cases, a penalty of 100 IT will be imposed on the validator who validated the proposal.

SERVICE PROVIDERS

SERVICE PROVIDERS

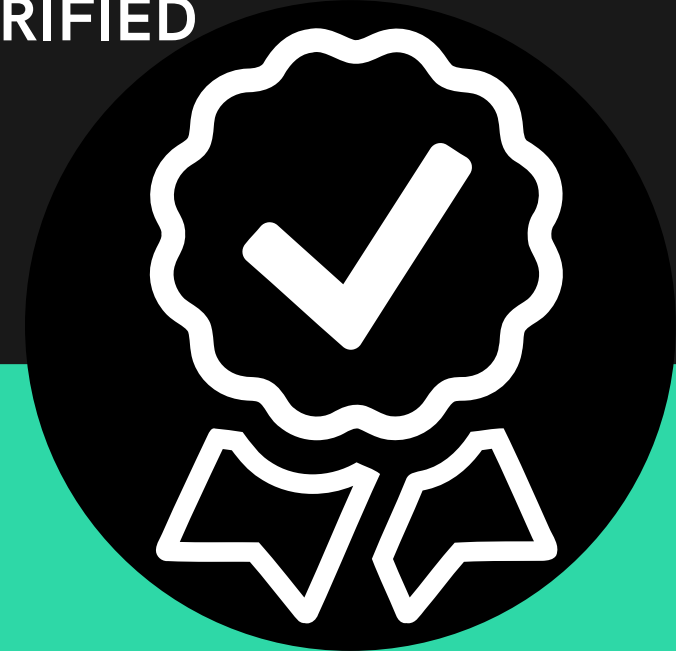

All web service providers, including Browsers, Domain Registrars, Hosting Providers, and DNS Providers, will be supported as supported providers.

SUPPORT

Werepl will support all major service providers globally such as AWS, Cloudflare, Google Cloud, Digital Ocean, GoDaddy, and all major browsers from the launch of the platform. Additionally, Werepl will continue to support new service providers as they emerge.

UNVERIFIED AND VERIFIED

When Werepl adds a new service provider to its list of supported providers, that provider will be unverified initially. However, once the provider approves or rejects 100 proposals, they will be verified by Werepl.

PASSES

What is a pass

Passes are unique SBTs that serve as on-chain proof of contribution to securing the web and enable users to claim rewards for their efforts.

What is an entry

Entry is the details of the proposal that the validator does to the user when the validator validates the user's proposal. If a user's pass expires, they can renew it without losing their existing entries.

Benefits

- Users will be able to claim daily reward pool shares for every entry made with their Passes.
- Users can proudly demonstrate their contribution to safeguarding the web and protecting online users.
- Users will have the exclusive privilege to enjoy enticing incentives from our esteemed partners, including token airdrops, staking rewards, and limited NFTs.

P A S S

\$4.99

- ✓ Amazing IT Rewards
- ✓ Incentives from partners such as token airdrops, staking, or limited NFTs
- ✓ Valid for One Year

IT

NATIVE TOKEN OF WEREPL

Purpose

The IT token serves three distinct purposes: staking, incentivizing users & validators, and payments.

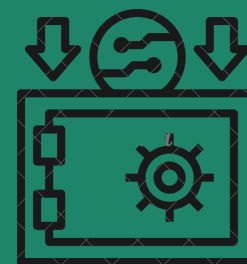

Supply

IT is inflationary with a fixed annual inflation of 3% and it doesn't have a maximum supply. The initial supply is 1 billion, plus the IT rewards earned by users and validators before the IT Token Generation Event (TGE).

Burning

20% of the platform's service fee revenue will be allocated for quarterly IT burning.

Staking

Validators will need to stake at least 10,000 IT after listing to validate proposals.

Incentivise Users

IT will incentivize the users who will be using the platform and validators that kept the platform operational.

Payments

The fees for Passes, APIs, Business Services, and Validator Listings can be paid in IT, along with BNB. If you pay in IT, the fee amount will be reduced by 20%.

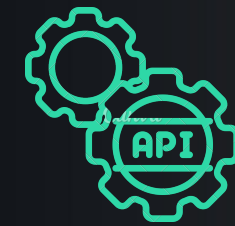

REVENUE MODEL

The platform will generate revenue in four ways

Passes

The platform will generate revenue from both the minting and renewals of passes.

APIs

The platform will generate revenue by charging fees to users who utilize our APIs.

Businesses

The platform will generate revenue by imposing fees on businesses that utilize our business services.

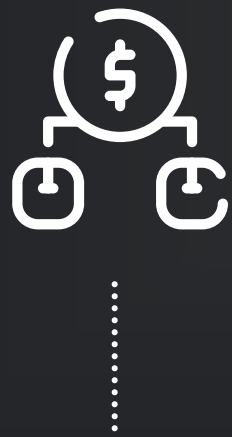

Validators

The platform will generate revenue from both listing fees and penalties collected from validators.

REWARDS

DAILY REWARDS

Every day maximum of 50,000 IT can be minted to incentivize users and validators.

Shares

Users:
As soon as the details of the proposal are entered on the user's pass, 1 share will be credited to the user.

Validators:
As soon as a service provider approves the proposal, and it's not rejected by two or more service providers, 1 share will be credited to the validator who validated that proposal.

Distribution

The daily reward pool is 50,000 tokens, split equally between users and validators.

Each gets 50%: $R_{users} = 0.5 * R_{total}$, $R_{validators} = 0.5 * R_{total}$.

To maintain fairness, the minting for each user or validator share is set at 0.2%: $M_{users} = 0.002 * R_{users}$, $M_{validators} = 0.002 * R_{validators}$.

Each Reward = $(\text{Number of IT distributed to the daily reward pool} / (2 * \text{Number of Total Shares})) * \text{Number of shares the user or validator has}$.

The reward calculation, minting, and distribution will be done every day at 00:00 UTC.
